

Order Manager FAQs

What are an order form element's extra attributes?

The *Extra Attributes* section specifies additional attributes that should be included in the HTML tag generated for the element. The format **attribute:value**.

For example, `onclick:check_form();` would add the attribute `onclick="check_form();"` to the order form element in question.

Extra attributes can be used to call JavaScript, perform CSS styling, or any other items that are handled by additional attributes within the HTML tag.

What template engine does the built in order form use?

Ubersmith uses the PHP projects Flexy ([HTML_Template_Flexy](#)) template engine.
