

Integrating Custom Domain Registrars

You can configure Ubersmith to use other registrars beyond the supported ones, Enom, OpenSRS, Namecheap, and Nominet.

Create the Registrar Module

- Create a domain module using [class.registrar.example.php](#) as an example.
- Ensure your custom registrar file name uses the `class.registrar` prefix.
- Ensure your class name uses the `registrar_` prefix.
- Ensure the string returned by the `name()` method (the name of your registrar) has no more than 20 characters.

Install the Registrar Module

- Save your file in the folder `/usr/local/ubersmith/app/custom/include/registrar/`.
- Restart the web container.
- [Add the custom domain to the Ubersmith Interface.](#)
