

Configuring Syslog-NG Device Modules

The Ubersmith Syslog-NG device module requires a `php-syslog-ng` setup. `php-syslog-ng` can be downloaded from:

<http://code.google.com/p/php-syslog-ng/>

Installation and maintenance of `php-syslog-ng` is outside of the scope of this document.

The Syslog-NG device module requires the mysql database which contains your `php-syslog-ng` data accessible from the Ubersmith host. You can then add the Syslog-NG device module to the appropriate device type / device group in:

Settings -> 'Device Manager' -> 'Device Types'

The module expects:

DB Host

The hostname / IP of your database server which contains the `php-syslog-ng` database.

Database

The database name.

DB Username

The username allowed access to the `php-syslog-ng` database.

DB Password

The password for the above user.

Rows to retrieve

By default, this is '5'; this is how many rows of log data will be displayed on the device's Device Manager page.

Once the module is configured, navigate to a syslog-ng monitored device in Device Manager and set the associated hostname by clicking 'edit' on the syslog-ng module.
