

# Configuring Email Blacklist Order Module

When the module runs, specific email domains are added to a list to be blocked.

- In the **Blacklist** field, enter the emails you want to block. One email address per line using regular expression syntax.

The screenshot shows the 'Add Order Action' configuration page in the 'ubersmith' interface. The 'Config' tab is selected, and the 'Blacklist' field contains the email address 'example@email.com'. Below the field, a note states '(one email per line, regex syntax supported)'. At the bottom of the form are three buttons: 'Save', 'Save & New', and 'Cancel'.
