

# Configuring SolusVM Client Integration Order Module

When the module runs, a user is created within SolusVM and then a virtual server for the client is provisioned. It works with the [SolusVM VServer Management service module](#) to deploy new SolusVM virtual machines.

- In the **SolusVM Host Device ID** field, enter the ID number of the host device.

## Extending the Module

To override the SolusVM VServer Management service module settings, add hidden fields using the following variables to your online order form. For example, if you have templates named template1 and template2, you can add the solusvm\_template hidden field with a value of template2 to override the default setting as configured in the service module. See [Adding Elements](#) for detailed instructions.

solusvm\_host\_device\_id

solusvm\_node

solusvm\_type

solusvm\_hostname

solusvm\_template

solusvm\_plan

solusvm\_customcpu

solusvm\_customram

solusvm\_customswap

solusvm\_customdiskspace

solusvm\_custombandwidth

solusvm\_ips
